DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 5/23/07 has been entered.

Allowable Subject Matter

2. Claims 4, 8, 9 and 14-20 are allowed.
3. The following is an examiner's statement of reasons for allowance: Prior art does not teach a calibration photodiode configured to convert light transmitted through the calibration area from the light source into an electrical calibration signal, the calibration signal being used to determine the degree of transparency of the calibration area; a calibration circuit operably coupled to the photo detector and the light source, the circuit being configured to compare the degree of transparency to a threshold value and in the event the threshold value is greater than or equal to the degree of transparency, the calibration circuit further being configured to increase a current provided to the light source to increase the brightness of light emitted therefrom in a direct of the indexing area and the encoding area.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Weber (US Patent 4,224,514) discloses devices similar to the current invention however Weber is silent about the transparency of the calibration area. Instead, Weber teaches the calibration area is attached to the sensor mask unlike the current invention (the calibration is attached on the same element as the encoding/indexing strip in the current invention). It is understood since the calibration area is attached to the sensing element, which might not locate close to the coding strip, Weber is more concerned about the light source integrity than the transparency of the coding strip.
